

AI Value-to-Scale Maturity Assessment

Can this organisation repeatedly move valuable AI into sustained operation?

Use: 10–15 minutes. Select the highest stage supported by current evidence—not ambition. This is a directional planning tool, not an audit, certification or benchmark. Keep this worksheet; Cognirise does not receive your answers.

The five stages

1 Exploring Opportunity discussed; evidence absent.	2 Proving Evidence in controlled conditions.	3 Activating Adopted workflow, controls and owners.	4 Operating Reliable, measured live capability.	5 Scaling Foundations and practices repeatedly reused.
---	--	---	---	--

Score the seven conditions

1. Value strategy Score: ☐1 ☐2 ☐3 ☐4 ☐5

How consistently does AI investment begin with a measurable operating outcome?

Evidence: Named outcome owner, baseline, value hypothesis and review cadence.

2. Use-case portfolio Score: ☐1 ☐2 ☐3 ☐4 ☐5

How consistently are opportunities compared, stopped and sequenced as a portfolio?

Evidence: Visible opportunity register, selection criteria, stop decisions and dependency map.

3. Data & platform readiness Score: ☐1 ☐2 ☐3 ☐4 ☐5

How reliably can teams reach governed data, tools and reusable production services?

Evidence: Approved access paths, quality measures, reusable interfaces and production support ownership.

4. Operating model Score: ☐1 ☐2 ☐3 ☐4 ☐5

How clearly do delivery, product, operations, technology and risk share accountability?

Evidence: Named decision rights, cross-functional team, acceptance gates and service ownership.

5. Workforce adoption

Score: ☐1 ☐2 ☐3 ☐4 ☐5

How well has real work changed—not only tools, training or communications?

Evidence: Redesigned roles, workflow measures, capability plans, adoption signals and feedback.

6. Governance & authority

Score: ☐1 ☐2 ☐3 ☐4 ☐5

How explicitly are authority, oversight, exceptions and fallback set for each AI handover?

Evidence: Handover inventory, authority ceilings, monitoring, exception path and automatic demotion.

7. Measured outcomes

Score: ☐1 ☐2 ☐3 ☐4 ☐5

How credibly can leaders connect live AI operation to sustained business and service outcomes?

Evidence: Operational baseline, outcome trend, control indicators, adoption measures and benefit owner.

Read the result

Add the seven scores and divide by seven. Round to the nearest whole stage only as a summary. The dimension pattern matters more than the label.

Total: _____ / 35 Average: _____ / 5 Directional stage: _____

Evidence rule: If a stage is not supported by the evidence prompt, select the highest lower stage that is supported. Stage 1 is the minimum.

Prioritize the result

Rank dimensions from lowest score to highest, using the worksheet order to resolve ties. If the average is below 4, select the first five. If it is 4 or above, select the first three as verification priorities.

1. Priority dimension	2. Evidence to create or revalidate
3. Accountable owner	4. Decision and date

Result wording: Scores 1–3 identify evidence gaps. Scores 4–5 identify evidence checks to sustain before the next scale step.

Use the same action logic as the web assessment

Select the action for each prioritized dimension according to its score.

Value strategy

1–3: Choose one material outcome, establish its baseline and name the executive owner.

4–5: Revalidate outcome baselines and ownership as the portfolio changes; stop work whose value case no longer holds.

Use-case portfolio

1–3: Score opportunities by value, feasibility, time to evidence, friction, control burden and reuse.

4–5: Challenge sequencing and stop decisions against fresh evidence, dependencies and reuse performance.

Data & platform readiness

1–3: Map the data and tool access needed for the highest-value workflow and close its first blocking gap.

4–5: Test whether reused services keep quality, access controls and accountable support owners at scale.

Operating model

1–3: Name the team that owns the route from evidence through operation, including its decision rights.

4–5: Rehearse cross-functional decision rights through one failure, exception or major change.

Workforce adoption

1–3: Redesign one role and handover around the workflow, then measure use and operating impact.

4–5: Check whether adoption and role measures reflect useful work, then address the weakest team signal.

Governance & authority

1–3: Apply the Agent Authority Model to the highest-exposure handover and define its fallback.

4–5: Reassess the highest-exposure handovers and prove fallback, intervention and demotion still work.

Measured outcomes

1–3: Create one outcome ledger linking operating, adoption and control measures to the value hypothesis.

4–5: Audit the ledger for attribution drift and confirm its measures still predict value.

Connect the next move

IDAO: moves selected work through Innovate, Demonstrate, Activate and Operate. **Agent Authority Model:** sets authority for individual handovers. **Value Scan:** optionally tests one priority process and its next evidence.

No contact exchange is required. Sharing these answers later is optional.

Model boundary: Proprietary Cognirise model. No statistical benchmark or compliance claim is made. Dated sources: cognirise.ai/methodologies/ai-value-to-scale
