

COGNIRISE PULSE · DIRECTIONAL ASSESSMENT

AI Value-to-Scale

A personal evidence map for deciding what your organisation needs to earn next.

Generated September 14, 2026

Result · Activating · 2.6 / 5

Evidence is converted into adopted workflows with named controls and owners. The label is a summary, not the decision: the dimension pattern and missing evidence determine the next work.

Answers remain on this page and are represented in the following evidence record.

Your seven answers

1. Value strategy — 1 / 5 · Exploring

Opportunities are discussed, but value and ownership are not yet evidenced.

Evidence prompt: Named outcome owner, baseline, value hypothesis and review cadence.

2. Use-case portfolio — 2 / 5 · Proving

Selected use cases can produce evidence in controlled conditions.

Evidence prompt: Visible opportunity register, selection criteria, stop decisions and dependency map.

3. Data & platform readiness — 3 / 5 · Activating

Evidence is converted into adopted workflows with named controls and owners.

Evidence prompt: Approved access paths, quality measures, reusable interfaces and production support ownership.

4. Operating model — 4 / 5 · Operating

AI capabilities run reliably, are measured, and improve through managed feedback.

Evidence prompt: Named decision rights, cross-functional team, acceptance gates and service ownership.

5. Workforce adoption — 5 / 5 · Scaling

The organisation repeatedly reuses foundations and operating practices to sustain value.

Evidence prompt: Redesigned roles, workflow measures, capability plans, adoption signals and feedback.

6. Governance & authority — 1 / 5 · Exploring

Opportunities are discussed, but value and ownership are not yet evidenced.

Evidence prompt: Handover inventory, authority ceilings, monitoring, exception path and automatic demotion.

7. Measured outcomes — 2 / 5 · Proving

Selected use cases can produce evidence in controlled conditions.

Evidence prompt: Operational baseline, outcome trend, control indicators, adoption measures and benefit owner.

Priorities, evidence and next actions

01 · Value strategy (1 / 5)

Evidence check: confirm named outcome owner, baseline, value hypothesis and review cadence.

Next action: Choose one material outcome, establish its baseline and name the executive owner.

02 · Governance & authority (1 / 5)

Evidence check: confirm handover inventory, authority ceilings, monitoring, exception path and automatic demotion.

Next action: Apply the Agent Authority Model to the highest-exposure handover and define its fallback.

03 · Use-case portfolio (2 / 5)

Evidence check: confirm visible opportunity register, selection criteria, stop decisions and dependency map.

Next action: Score current opportunities by value, feasibility, time to evidence, friction, control burden and reuse.

04 · Measured outcomes (2 / 5)

Evidence check: confirm operational baseline, outcome trend, control indicators, adoption measures and benefit owner.

Next action: Create one outcome ledger linking operating, adoption and control measures to the value hypothesis.

05 · Data & platform readiness (3 / 5)

Evidence check: confirm approved access paths, quality measures, reusable interfaces and production support ownership.

Next action: Map the data and tool access needed for the highest-value workflow and close its first blocking gap.

Next steps

01 Use the lowest-scoring dimensions to choose the next evidence review, not to claim a maturity benchmark.

02 Optionally take the separate Value Scan when a facilitated value and delivery conversation is useful.

03 Reassess after the evidence, ownership or operating context changes.

Privacy and limitations

This is a directional planning tool, not an audit, certification or benchmark.

Answers are generated locally from this page and are not sent to Cognirise or included in the separate Value Scan form.

Method version: AI Value-to-Scale · current public questionnaire.
